

Phase of Journey	Stage 1: Data Gathering & Hurdles	Stage 2: Interface Discovery	Stage 3: Fast Prediction & Insights
Actions <i>What does the customer do?</i>	The analyst sifts through massive, unorganized historical socioeconomic spreadsheets (HDI.csv) to track indicators.	The analyst opens the newly deployed Flask web interface to input target well-being parameters.	The analyst clicks the submit button, views the generated index score, and maps out regional aid strategies.
Touchpoint <i>What part of the service do they interact with?</i>	Raw CSV text data files, country development databases, and local storage directories.	The interactive web browser form page (http://127.0.0.1:5000) containing numerical input fields.	The web browser frontend output block presenting the final generated well-being score.
Customer Thought <i>What is the customer thinking?</i>	"Socio-economic indicators are far too complicated to merge and calculate manually."	"This uncluttered template layout makes it incredibly straightforward to input regional data variables."	"I can instantly test multiple hypothetical policy scenarios with a single click without breaking any code."

Customer Feeling <i>What is the customer feeling?</i>	Frustrated by the slow turnaround times of manual data interpolation and messy empty cell blocks.	Relieved to see a clean user interface that bypasses complex mathematical computations.	Confident and satisfied with the lightning-fast, data-driven regression intelligence output.

Customer Journey Map

Map out the customer's experience stage-by-stage, capturing their actions, touchpoints, thoughts, and feelings, along with process ownership and improvement opportunities at each stage.

Process Ownership <i>Who is in the lead on this?</i>	Data Engineer / Data Analyst (K Likith)	Full-Stack Developer (K Likith)	Project Lead / Deployment Specialist (K Likith)
Opportunities <i>How can we improve this stage?</i>	Build an automated backend script to clean, format, and fill missing data cells dynamically.	Integrate inline text validation alerts to warn users if they input values outside logical boundaries.	Add a data export button to download the finalized predictions directly into a PDF report summary.
